

## LISTING OF CLAIMS

1. (currently amended) An electronic ~~Electronic~~ device, comprising:

a plurality of interfaces for connecting output units to said device,

a control unit for controlling the routing of messages, said messages being determined to be presented to a user of said device via at least one of said output units, said control unit being configured for:

determining at least one of said output units for routing a message to based on a results of a message classification process wherein said message classification process comprises analysis of said message and dynamic classification of said message based on at least one of message content analysis, presentability, sender and confidentiality level, and routing said message to an ~~that~~ interface serving said determined output unit.

2. (original) The electronic device as recited in claim 1, further comprising a stored look-up table with classification levels being allocated to output units.

3. (currently amended) The electronic device as recited in claim 1, further comprising a classification unit for running said classification process for classifying messages to be output ~~messages~~.

4-7 (canceled)

8. (currently amended) The electronic device as recited in claim 1, comprising an identification unit for identifying available connected output units and for making said control unit determine only one or more of said identified available output units for message routing ~~a message to~~.

9. (currently amended) The electronic device as recited in claim 1, wherein said electronic device is a portable device.

10. (currently amended) A method for routing an electronic message from an electronic device to an output unit, comprising automatically controlled steps of:

determining at least one of several output units based on a result of a message classification process, wherein said message classification process comprises analysis of said message and dynamic classification of said message based on at least one of message content analysis, presentability, sender and confidentiality level, and  
initiating said message to be routed to said determined output unit for presenting said message to said user of said electronic device.

11. (original) The method as recited in claim 10, wherein said message is classified and said classification result is provided.

12-15. (canceled)

16. (currently amended) The method as recited in claim 10, wherein the availability of output units is checked, and

wherein only one or more of the available output units can be determined for message routing ~~said message to~~.

17. (currently amended) A program storage device readable by a digital processing apparatus and having a program of instructions which are tangibly embodied on the storage device and which are executable by the processing apparatus to perform a method of routing an electronic message from an electronic device to at least one of a plurality of output units, said method comprising:

determining at least one of said output units based upon a message classification process, wherein said message classification process comprises analysis of said message and dynamic classification of said message based on at least one of message content analysis, presentability, sender and confidentiality level, and  
initiating said message to be routed to said determined output unit for presenting said message to a user of said electronic device.
